GFI Protected Outlets

Upgrading outlets with GFI protection is an inexpensive safety feature.

GFI (ground fault interrupter) outlets are recommended near any water source - kitchens, bathrooms, basements, exterior, and garages.

This device is designed to interrupt an electrical current in the event of electrocution or an electrical surge. New construction building codes require GFI protected outlets as well as many lenders and FHA/VA backed loans.

But, common sense may be the best reason to have GFI protected outlets installed. Your home inspector will test and recommend these outlets be installed where needed. Do it for you and your families health and well being.
