NUMEROUS WIRING DEFECTS

Any wiring defect presents a fire & shock hazard

There is a misconception that wiring upgrades and adding circuits, lights, or additional outlets is something a homeowner is capable of doing. When in fact, homeowner type wiring is the single largest fire hazard in a home.

Homeowners with just basic knowledge of wiring are known to cut corners creating potential fire and shock hazards with loose run wiring, outlets wired in neutral reverse, improper splices, and or overloading a circuit.

All too often we find improper wiring concealed behind finished basement walls or drop panels in the ceiling that present a safety hazard.

If your home inspector recommends further evaluation and wiring upgrade – he did not mean for you to do them! Protect yourself and your family by hiring a licensed electrical contractor for these upgrade...no matter how small the job.
